### HOW TO CITE CHILDREN & CRITICAL CARE SERVICES MODULE:

We encourage you to share these documents with others and we welcome their use as a reference. Please cite each document in the module in keeping with the citation on the table of contents of the respective documents. If referencing the full module, please cite as:

Child Health BC. *Children & Critical Care Services*. Vancouver, BC: Child Health BC, Approved Jan 2019; Minor Update Nov 2020.

## Critical Care Services for Children: Setting the Stage for Tiers Development

The Children & Critical Care (CC) Tiers module is made up of two components:

1. Setting the Stage for Tiers Development (provides the context - **this document**)
2. Tiers to Support System and Operational Planning (provides a description of the tiers and the corresponding responsibilities and requirements)

The Children & Critical Care Tiers module focuses on services provided by *specialist* and *subspecialist* health care providers to children up to 17 years old (16.9 years) who have *highly acute* and often *highly complex* illnesses, injuries and complications. It builds on and is intended to be used in conjunction with the *Children's Emergency Department, General Medicine* and *Surgery Tiers* modules.

All facilities providing pediatric services (T1-T6) should have capacity to provide resuscitation and initial stabilization of critically ill children while awaiting transport to a higher tier (in ED, on an inpatient unit &/or in ICU). This module focuses on critical care services which are provided **beyond** the resuscitation and initial stabilization period.

"Critical care services" refer to services which are **above and beyond those usually available on a pediatric inpatient unit** (refer to children's medical and surgical modules for details of what is usually provided on a pediatric inpatient unit). Provision of these services requires **specialized skills** and **enhanced staffing levels**. In BC, such services are usually provided in a pediatric-specific or a general intensive care unit.

### 1.0 Providers of Critical Care Services for Children

Critical care services for children are provided by a range of physician specialists and subspecialists, in partnership with nurses, allied health and other members of the health care team. In many cases, the physicians have specific training in critical care medicine (CCM).

CCM is a relatively new Royal College of Physicians and Surgeons-recognized subspecialty. CCM has multiple different base specialties that serve as a route for entry including pediatrics, anesthesiology, cardiac surgery, emergency medicine and general surgery. Within CCM, there is an adult and a pediatric stream. In Canada, there are 21 Royal College accredited CCM training programs - 13 adult and 8 pediatric.<sup>1</sup> There are 13 pediatric CCM physicians in BC, 9 at BCCH and 4 in Victoria.

---

## 2.0 Utilization of Intensive Care Units by Children

Highlights of the data used to inform the development of this module are provided in this section. Data is for 2020/21 and children ages 0 - 16.9 years unless otherwise stated.

Refer to Appendices 1 - 3 for detailed tables. Appendix 4 provides a summary of designated pediatric beds in BC, including pediatric ICU (PICU) beds. BCCH has 22 PICU beds and Victoria General has 5 beds. Additionally, the University Hospital of Northern BC (UHNBC) has 4 beds with the capacity for more intensive monitoring, up to and including continuous cardiorespiratory monitoring.

### 2.1 ICU Visits & Days

#### 2.1.1 Visits and Days, 4-Year Trend

In 2020/21, 1,125 children were discharged from an ICU in BC (3.0 admissions per day). These children occupied 3,254 ICU bed days (8.9 beds per day) and had an average length of stay (ALOS) of 2.9 days. See Table 1 (Appendix 1 for details).

**Table 1: ICU Visits & Days, Children 0 - 16.9 Yrs, 2016/17 to 2020/21 (CIHI)**

Activity	2020/21	2019/20	2018/19	2017/18	Difference, 2019/20 - 2016/17
ICU Visits	1,125	1,590	1,643	1,630	-505
ICU Days	3,254	5,722	5,474	5,715	-2,461
ALOS	2.9	3.6	3.3	3.5	-0.6

#### 2.1.2 Ages of Children Treated in ICU

The highest proportion of ICU visits and for children were between 2 and 13.9 years of age: 47% of total visits. The highest proportion of ICU days for children were less than 2 years of age: 45% of total days (for 40% of total visits). 11% of BC's children were in the less than 2 years age group, while 71% were in the 2 - 13.9 years age group. See Table 2 (Appendix 1 for details).

**Table 1: ICU Visits & Days by Facility & Age of Child, Children 0 - 16.9 Yrs (CIHI, 2020/21)**

Treating Hospital	ICU Visits					ICU Days				
	< 6 mos	6 mos to 1.9 yrs	2 - 13.9 Yrs	14 - 16.9 Yrs	Total	< 6 mos	6 mos to 1.9 yrs	2 - 13.9 Yrs	14 - 16.9 Yrs	Total
BCCH	170	116	327	75	688	763	386	1,004	186	2,339
Victoria General	33	31	101	30	195	68	67	191	80	406

### 2.1.3 Visits and Days by Treating Hospital

The highest number of ICU visits and days for children were at BC Children's Hospital (BCCH), Victoria General Hospital (Vic Gen) and University Hospital of Northern BC (UHNBC). Combined, these represented 89% of total ICU visits and 93% of total ICU days. See Table 3 (Appendix 1 for details).

**Table 2: ICU Visits & Days by Facility, Children 0 - 16.9 Yrs, (CIHI, 2020/21)**

Treating Hospital	ICU Visits		ICU Days	
	#	% Prov Total	#	% Prov Total
BCCH	688	61%	2,339	72%
Victoria General	195	17%	406	12%
UHNBC (Prince George)	125	11%	281	9%
Other BC Hospitals	117	10%	228	7%
<b>Total</b>	<b>1,125</b>	<b>100%</b>	<b>3,254</b>	<b>100%</b>

### 2.1.4 Visits and Days by Location of Child's Home Residence

The highest proportion of visits and days were by children living in the Fraser Health Authority (FHA): 29% of total visits and 31% of total days. FHA has more children than any other HA.

On a per capita basis, children living in Northern Health utilized an ICU more often than children living in the other health authorities.

See Table 4 (Appendix 2 for details).

**Table 3: ICU Visits & Days by HA of Child's Home Residence, Children 0 - 16.9 Yrs (CIHI, 2020/21)**

HA of Child's Home Residence	ICU Visits		ICU Days		% BC Child Pop'n
	#	% Prov Visits	#	% Prov Days

<b>Out of Prov/Unknown</b>	<b>21</b>		<b>54</b>		
<b>Total, All</b>	<b>1,125</b>		<b>3,254</b>		

## 2.2 Reasons for ICU Visits

### 2.2.1 Mode of Entry

The most common routes of entry to ICU by children were direct entry or via emergency. A smaller number were admitted via a clinic or day care surgery from within the same hospital.

**Table 4: Mode of Entry of ICU Visits, Children 0 - 16.9 Yrs (CIHI, 2020/21)**

Treating Hospital	ICU Visits				Total
	Direct <sup>(1)</sup>	ED	Clinic	Day Surgery	
BCCH	456	223	8	1	688
Victoria General	116	78	1	0	195
UHNBC (Prince George)	61	18	46	0	125
Other BC Hospitals	21	93	1	2	117
<b>Total</b>	<b>654</b>	<b>412</b>	<b>56</b>	<b>3</b>	<b>1,125</b>
<b>% Prov Visits</b>	<b>58%</b>	<b>37%</b>	<b>5%</b>	<b>0%</b>	<b>100%</b>

<sup>(1)</sup> Direct entry includes:

- Children admitted to ICU from another area within the same hospital (e.g., medical unit, OR, etc), excluding the Emergency Department or a clinic; and
- Children admitted to ICU from another hospital.

### 2.2.2 Major Clinical Categories/Case Mix Groups

The most common clinical categories for admission to ICU in 2020/21 were: circulatory (17%) and nervous system (13%), and trauma/injury/poisoning and toxic effects of drugs (11%). See Table 6. This differs from previous years when respiratory issues were the most common category (23% in 2019/20).

The most common case mix groups were major cardiothoracic interventions (11%), major cardiothoracic intervention with pump (7%), poisoning/toxic effects of drug (4%) and seizure disorder (4%). See Appendix 3 for details.

**Table 5: Visits by Major Clinical Category, Children 0 - 16.9 Yrs (CIHI, 2020/21)**

Major Clinical Category (MCC)	ICU Visits		ICU Days	
	#	% Total ICU D/C'es	#	% Total ICU Days
Diseases & Disorders of the Circulatory System	196	17%	397	12%
Diseases & Disorders of the Nervous System	141	13%	344	11%
Significant Trauma, Injury, Poisoning & Toxic Effects of Drugs	123	11%	276	8%
Newborns & Neonates with Conditions Orig in Perinatal Period	111	10%	515	16%
Diseases & Disorders of Ear, Nose, Mouth & Throat	106	9%	162	5%
Diseases & Disorders of the Respiratory System	104	9%	635	20%
Diseases & Disorders of the Endocrine System, Nutrition & Metabolism	104	9%	192	6%

### 2.3 HA of Treating Hospital versus Location of Child's Home Residence

57% of children accessed ICU services in a hospital in their home HA. This ranged from 0.5% of children living in Fraser to 96% living in Vancouver Coastal. See Table 7.

**Table 6: HA of Treating Hospital versus Location of Child's Home Residence (CIHI, 2020/21)**

HA of Treating Hospital	Child's Home Residence					Total Visits, excl Other	Other	Total Visits, incl Other	% Prov Visits
	Interior	Fraser	Van Coastal	Van Island	Northern

Note: For the purposes of this table, children from VCH that were admitted to either a VCH hospital or BCCH were assumed to have received the service in their home HA.

### 3.0 Literature on Volumes & Outcomes

In preparation for development of the original Children & Critical Care Tiers module in 2019, a literature search was undertaken on the relationship between volumes and outcomes in adult, pediatric and neonatal ICUs. Most of the literature focused on adult and not pediatric or neonatal ICUs.

Although the literature is conflicting, most studies suggest a positive relationship between volumes and outcomes (higher volumes, better outcomes). Some noted the relationship existed only for high risk/complexity patients.

#### *Adult ICUs:*

- Most studies/literature reviews suggest there is a relationship between volumes and outcomes (higher volumes, better outcomes),<sup>1-5</sup> although some report no relationship.<sup>6-8</sup>
- One literature review (n=20 studies) suggested there was a high volume threshold at which point the risk benefit is lost (more than 450 cases per year per diagnostic category and more than 711 cases not specific to a diagnostic category). Optimal ICU performance was noted to be between low and high volumes.<sup>1</sup>
- One systematic review and meta-analysis (n=29 studies) found that 63% of the studies reported a statistically significant association between higher admission volumes and improved outcomes. The magnitude of the benefits was greatest in selected high risk conditions (cardiovascular, respiratory, severe sepsis, hepato– G.I., neurologic and postoperative admission diagnoses).<sup>9</sup>
- Two individual studies that focused on specific patient groups only (e.g., renal, subarachnoid hemorrhage) concluded a positive volume/outcome relationship.<sup>10,11</sup>
- One study of 29 ICUs in Spain reported no relationship between volumes and outcomes.<sup>12</sup> Another concluded the benefit was seen only in high-risk patients<sup>13</sup> and another only with certain diagnoses.<sup>14</sup>
- One study concluded the number of pressure ulcer prevalence and catheter-related bloodstream infection rates were higher in larger hospitals.<sup>15</sup>
- One study showed that reduced ICU bed availability was associated with increased rates of ICU readmission and ward cardiac arrest.<sup>16</sup> One literature review identified 70 - 75% to be the optimal ICU occupancy rate.<sup>17</sup> Another study did not show a relationship between ICU bed availability and occupancy.<sup>18</sup>

*Pediatric ICUs:*

- There are less studies/literature reviews published on volume and outcomes in pediatric ICUs.
- 3 articles show a relationship between PICU volume and morbidity/mortality (higher volumes, better outcomes):
  - Tilford's study<sup>19</sup> examined the volumes & outcomes in 16 PICUs that ranged from 4 - 20 beds (147 - 1,246 admissions/yr, with an average of 863/yr). The study reported significant effects of patient volume on both risk-adjusted mortality and patient length of stay. A 100% increase in PICU volume decreased both risk-adjusted mortality (adjusted odds ratio: .95) and reduced length of stay (incident rat ratio: .98). Factors such as fellowship training programs, university hospital affiliation, number of PICU beds and children's hospital affiliation had no effect on risk-adjusted mortality or patient length of stay.
  - Marcin's study<sup>20</sup> examined the volumes & outcomes in 15 PICUs (152 - 2,156 admissions/yr). On average, admission to higher-volume PICUs was associated with lower severity-adjusted mortality (odds ratio = 0.68 per 100 patient increase in volume). However, although severity-adjusted mortality rates decreased as annual PICU admission volumes increased, there was a slight increase in mortality rates among PICUs with very high annual admission volumes. This suggests that, although increasing PICU volumes are on average associated with lower mortality rates, there may be a point at which increasing volume not only does not result in further reductions in severity-adjusted mortality rates, but may be associated with some increase in mortality rates. The lowest severity-adjusted mortality rates were among PICUs with annual admission volumes between 992 and 1,491.
  - Ruttman's<sup>21</sup> study examined the relationship between diagnostic diversity within a PICU and mortality risk. The study concluded no relationship although did note a small but significant volume effect present. A volume increase of 10 patients/month was associated with a 4% decrease of the adjusted mortality odds ratio.
- One PICU article showed a relationship between ICU volume and LOS (higher volume, shorter LOS) for critically ill children with acute asthma.<sup>24</sup>
- One PICU study (Markovitz<sup>22</sup>) examined the volumes & outcomes in 92 PICUs (186,643 patients). For patients with low severity of illness, PICU volume was not a related to mortality. For patients with high severity of illness, PICU volume is inversely related to mortality (i.e., higher PICU volumes were associated with higher risk– adjusted mortality). Potential explanations included differences in quality of care, issues with unmeasured con founding or calibration of existing severity of illness scores. Kahn<sup>23</sup> in a later article noted the relationship was conditional on severity of illness and that the association between higher volume and higher risk of death was largely confined to more acutely ill patients. He proposed that the study results could be attributable to limitations in the study design, including differing case-mixes between high volume and low volume PICU's.

*Neonatal ICUs:*

- 3 articles in the NICU literature showed a relationship between higher volumes and better outcomes.<sup>25,26</sup>

Source: Survey of CHBC Regional Coordinators, March 2023.

**Note: Several hospitals in BC do not have dedicated pediatric beds but admit children to beds on adult inpatient units. These hospitals are not included on the list above.**

<sup>12</sup> Beds have capacity for invasive monitoring, inotropic drugs, and mechanical ventilation.

<sup>13</sup> Excludes beds in home-based settings and supportive recovery beds.

<sup>14</sup> Substance use beds are funded by the HA but operated by an external agency. Exceptions: Creekside (Surrey) and Nechako (Prince George) are funded & operated by the HA.

<sup>15</sup> 14 beds: 5 child, 6 youth & 3 special care (assessment/stabilization) beds.

<sup>16</sup>Planned seasonal increase to 24 beds Oct-April. 4 beds available with increased safety and monitoring for mental health.

<sup>17</sup> Short-term residential withdrawal management program, ages 13-18

<sup>18</sup> Includes 1 detox bed.

<sup>19</sup> 4 beds have the capacity for more intensive monitoring, up to and including continuous cardiorespiratory monitoring.

<sup>20</sup> 2 beds for planned admissions and 4 for crisis stabilization.

<sup>21</sup> Includes 14 beds at Looking Glass (up to age 24), a residential eating disorders program operated by PHSA (BC Mental Health & Substance Use Services and BCCH) in collaboration with the Looking Glass Foundation.
